Part 1: Background

Analog Signals

Definition: A signal is the evolution of the value of some metric, or *time* \mapsto *value*.

Normally, with regards to electrical signals, what we care about is the voltage.

Voltage can “*easily*” be measured.

A cyber-physical system bridges the cyber world and the physical world.

Voltage

Definition: A difference in electrical potential.

Implication: The metric relates to two points in a circuit.

Connecting two circuits by one wire will not drive a standing current.

We say that they *float*.

Ground (or GND) is needed for *grounding* the voltage.

Connecting 3V on **circuit A** to ground on **circuit B** will make 3V on **circuit B** equivalent to 6V from the context of **circuit A**, and the ground of **circuit A** equivalent to -3V from the context of **circuit B**.

Transducers

Definition: A device which converts energy from one form to another.

Inputs include:

- ▶ Light
- ▶ Heat
- ▶ Force
- ▶ EM Radiation
- ▶ ...

Outputs include:

- ▶ Electrical signal (Voltage)
- ▶ ...

Thermistors

Voltage dividers:

$$V_{out} = V_{in} \cdot \frac{R_2}{R_1 + R_2}$$

A thermistor (R_2) is a component whose resistivity is a *reversible* function of the temperature.

How does this affect the equation?

Assumption: high temperatures \Leftrightarrow high resistance.

Then:

- ▶ high $V_{out} \Rightarrow$ high $R_2 \Rightarrow$ high temperature.
- ▶ low $V_{out} \Rightarrow$ low $R_2 \Rightarrow$ low temperature.

Serial Communication

Introduction

What is serial communication?

Definition: A way of transferring a chunk of data one bit after the other.

There are many ways of doing so ...

- ▶ SPI *"spy"*
- ▶ I2C *"I-squared-C"*
- ▶ RS232 (the subject of today)

In its simplest form, RS232 is a three wire protocol:

1. Communication in one direction
2. Communication in the other direction
3. Ground

RS232 Frame Format

Contents of the RS232 frame (transmitted at some **baud rate**):

- ▶ 1 start bit
- ▶ a *character* spanning 7-8 bits (we will focus on the full byte)
- ▶ an (optional) parity bit which may follow one of a number of standards
- ▶ a number of stopbits (usually 1-3)

Working with Incoming Data

How do you decide what to do with data arriving to the device?

Choices on data format:

1. Machine-readable makes it simple to parse
2. Human-readable makes it simpler to debug

Choices on dispatch mechanism:

1. Lookup using table
2. Lookup using map
3. Chain of branches
4. Deterministic finite automaton
